Trees for Beauty, Health, Happiness

THIS is a book about DOBE TREES!

It is our great pleasure to dedicate it to those thousands of nature-loving folks who enjoy lovely surroundings for their homes, attractive settings for their places of business and charming grounds for their recreational facilities. It is the purpose of the following pages to explain how all of these may be acquired easily and at a price which most everyone can afford to pay.

Throughout many years of service it has been an inspiration and delight to us to give helpful information and aid in making homes and gardens more attractive. The first step in doing this is to introduce our beautiful and sturdy trees. This we do in pictures made from actual photographs and descriptions which we are certain you will find most interesting.

Study these pictures and descriptions. Then picture in your own mind, if you can, how a selection of these fine trees would improve your surroundings . . . and then let us assist and advise you with your particular problem.

Trees

NATURE'S GREATEST CONTRIBUTION TO MANKIND'S JOY AND COMFORT

From time immemorial TREES have brought comfort and joy to mankind. They have provided shelter from the rays of the sun and protection from the winter winds. They have supplied sustenance and material for the very roofs over our heads. Food, clothing and shelter are of course essential to our existence, but there are other essentials for complete living, and one of these is the need to look upon and be with the grand beauty of nature.

What is there in a TREE that inspires us with reverence and delight? What is it that has enabled some trees to outlive generations of men, and still be young and vigorous? The struggles that a tree goes through in its own lifetime offers us an inspired example of true courage and real character, which man would do well to imitate.

The poet tells us, "Groves of trees were God's First Temples." Long the subject of song and story, TREES surely rank among the sublime beauties of the universe. They can be as fascinating to the layman as they are to the poet, the artist, the philosopher and scientist. Of the tree-loving public, who among us has not, at one time or another, admired some noble tree and wished that it was his own? TREES, somehow are associated with the hope and vigor of our youth and the peace, contentment and well-being which we hope will attend our old age.

TREES should be owned and loved as individuals, each with traits of its own and each with its peculiar needs for light and food and moisture. The pleasure and companionship afforded by trees can be truly appreciated only by living close to them. For the kinship which man has felt with trees goes deeper than the mere desire for the physical needs which they supply.

There is a marked structural relationship between trees and man. They eat and digest their food as we do; they sleep and their sap is similar to our blood. When wounded, their tissues give forth a protective liquid, healing and antiseptic, just as in the human body a skin or protective covering forms over the wound. TREES thus possess a common bond with everything that lives, especially man, who since he has the power to think, is in a better position to appreciate it if he only would.

The beauty of a tree is plain to be seen, but the hidden complexities of the natural manufacturing plant are seldom appreciated, either by the gardener, who blindly uses tree products, or by the apartment dweller, who seeks the coolness created by park trees.

Nature has provided the majesty and grace of trees; we, of the Dobe Tree Farm have assisted her in making them perfect and in making their beauty available to you.

PLANT TREES FOR LIFELONG
ENJOYMENT

See this beautiful tree! It is a Vase Elm . . . perfect for lawn, street or park planting. It is a large Dobe tree . . . photographed on the Dobe Tree Farm. Here is a tree that will gladden the eye in the spring and add gaiety to the autumn scene. We can transplant this tree or others like it for you, with the assurance that it will be just as beautiful on your grounds as it appears in this picture.

DOBE
Tree Farm

Plant Large Trees

A SOURCE OF IMMEDIATE PRIDE AND PLEASURE

We recommend earnestly that our customers consider and BUY LARGE trees—trees which have reached such growth that they will be an immediate source of pride and pleasure. Our larger sizes of shade trees and evergreens are vigorous and hardy, and have received thorough care and training during their formative stages which many years of specializing in such work has enabled us to give them.

Many people who buy or build a new house or business property make the mistake of trying to dress up the grounds with under-sized, puny trees. Then because of lack of knowledge or facilities to give these trees the care necessary for proper growth in the first tender years of their existence, these under-privileged youngsters never attain the beauty and size of which their species is capable, and the unhappy owners seldom if ever enjoy the effects desired in, and around their properties.

It is all important in landscape planting that each unit should reach the ultimate goal of completion and perfection at an early time. It is difficult to conceive, therefore, how any home owner or business man would plan for an early future of pleasure and comfort in new buildings, yet be willing to wait five to ten years for his grounds to catch up with his buildings in appearance.

Appreciation of the value of time in this busy world of ours, has created a demand for large trees. More and more people are beginning to realize what a mistake it is to allow an otherwise attractive layout to be completely spoiled by the unfinished, ragged effect which only small-sized trees can give. Large trees have character and cost comparatively little more than smaller sized trees and give a greater measure of satisfaction to be enjoyed AT ONCE.

Some people have the idea that the thing to do when they build or buy a new property, or remodel an old one, is to put in a few little trees—mere seedlings—and then sit and watch them "grow." We wish to point out, strongly and sincerely, the fallacy of such a proceeding—we want to warn you against the pitfalls which endanger the very life of a young tree.

Unfortunately, some property owners think that since trees in the woods have always grown without help from man, the ornamental trees about our residences and places of business should do the same. If it were possible for us to give our ornamental trees the same growing conditions that they have in the forest, they would of course grow well. The average property owner cannot do this and in the more or less artificial surroundings in which young trees often find themselves, it is usually a gamble whether they will grow at all.

Why WAIT five to ten years for a small tree to grow into a reasonable size worth calling a tree? A LARGE tree is "growing" faster than a small one and can be just as much "your" tree as a small one—as much of enjoyment to you day by day and certainly a more IMMEDIATE source of satisfaction.

Young trees on THE DOBE TREE FARM receive just the right feeding and pruning both above and underground. We keep our trees until they are perfect specimen quality trees, and when we plant them out we know they are well-equipped to be a satisfaction, increasing in value, beauty and dignity as year follows year.

We have complete, proper equipment for handling large trees. WE KNOW HOW. We dig each tree fresh and we welcome a visit to the DOBE TREE FARM for the purpose of personal selection of trees. WE GUARANTEE TREES FURNISHED AND PLANTED BY US if proper care is given them after being planted.

DON'T WAIT . . . PLANT
LARGER TREES NOW!

A Group of Colorado Blue Spruce in
the Field . . . Dobe Tree Farm.

A stately Norway Maple planted in close proximity to the house and providing welcoming shade on summer days.

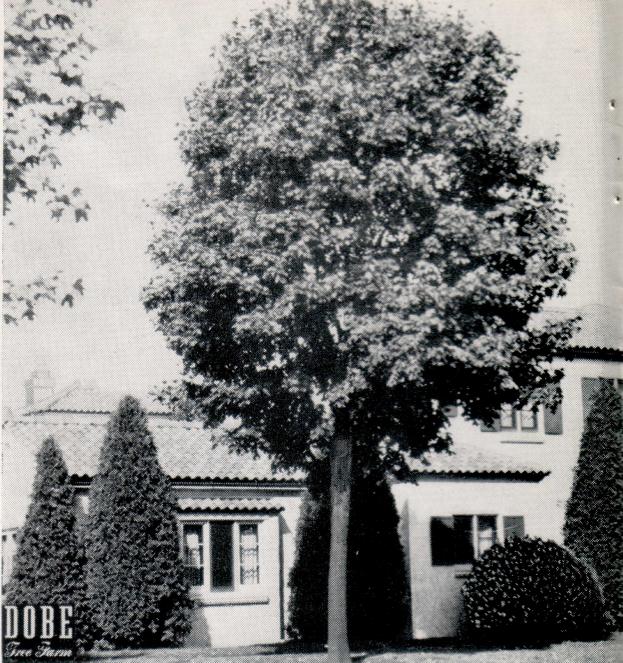

When the Summer sun drenches the earth in sunshine we often think of the leafy greenness and cool shade of some tree. Sunday afternoons and holidays, parks and other wooded areas are thronged with people—all seeking relief from an over abundance of the sun's rays and to enjoy the shade afforded by trees. If people venture forth at all for a walk or a ride in the hot weather, it is the tree-shaded street or highway that invites them. The stay-at-homes seek the cool side of the house, and how often there is a cool side of the house in Summer only because of the protection of some tree.

The man who plants trees conveys a lasting benefit to himself and posterity. Business cycles come and go; man-made investments depreciate in value, but the trees remain. They are the friends of man as they are of birds. They ask little and give much.

In the modern mode—with sharp outlines and stream-lined brevity prevailing in architectural design, trees are more than ever indispensable to an enchanting picture. Shade trees are not a luxury but a practical improvement to property. Properly placed, they shield and protect buildings and possessions and make residential sections more attractive and healthful.

The increase in the value of a tree over a period of years represents a return on the actual amount of money invested originally unparalleled in this period of low interest return. Trees add actual money value to your property and real estate owners know that trees add as much as \$158.00 per 6 inch diameter tree to any property. Appraisal engineers recognize the value of trees on industrial property.

We are equipped to furnish and plant large specimens of many of the better and more desirable varieties of shade trees suitable for your locality. Let us tell you personally what shade trees you can plant NOW.

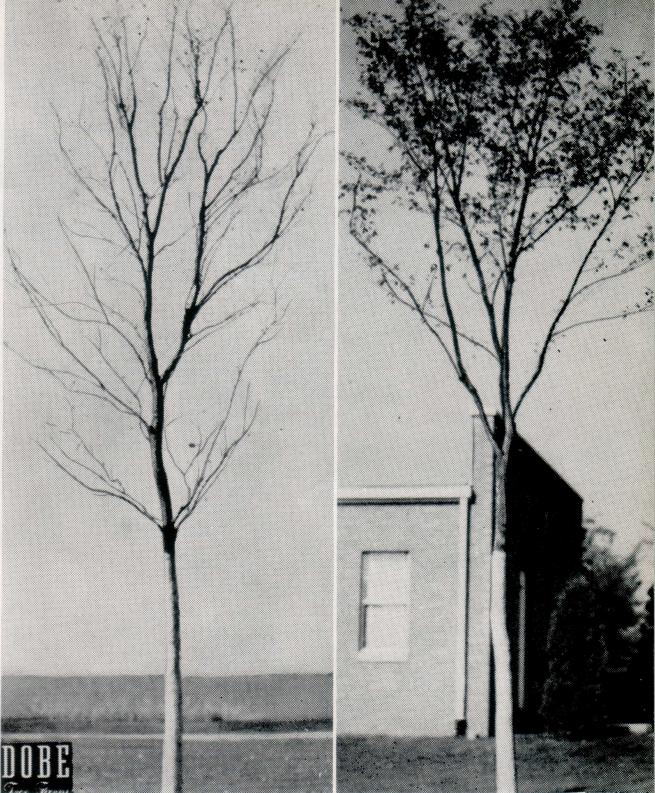

Shade Trees

JOYOUS . . . LUXURIOUS . . . AND A
PRACTICAL INVESTMENT

American Elm

Easily the most popular shade tree in America, the American Elm adorns lawns and streets throughout the length and breadth of the land. It is sturdy, sound and weather-resisting and grows rapidly. The wood is tough-grained and it can be placed at the head of the "permanent" class of ornamental trees. It grows to a very large size, 60 feet to 120 feet high. Tall and graceful, if given room, its limbs arch out into a wide-spreading fan, which loses itself in numerous fine branches. Because of its size, dependability and its beautiful crown, it is recommended and extensively used for lawns and permanent parkways. It is particularly valuable in framing a house or lining a broad avenue. The illustrations show two American Elms trans-

Two American Elms. (Transplanted). Shown in Autumn and in Springtime Dress.

planted, with trunks wrapped with burlap from the Farm. Note the sturdy, well-formed limbs of this variety, giving it the noble upright appearance which is its habit.

Moline Elm

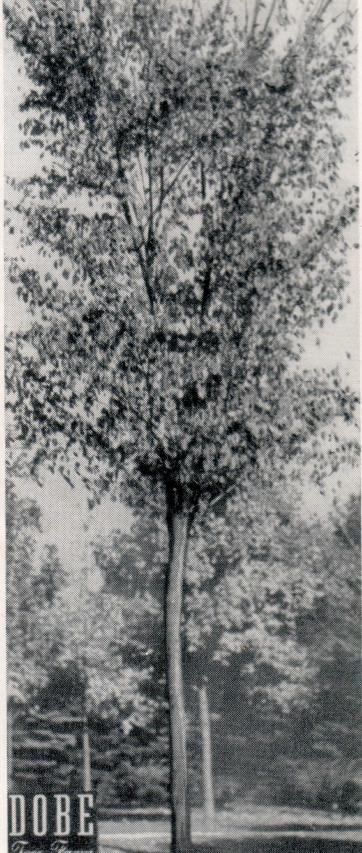

Somewhat taller than the American Elm, this shade tree has strong, symmetrical branches, raising upwards to a great height. It is conical in shape when young, the older trees becoming more spreading with branches nearly horizontal. It is fast-growing and the leaves are often six inches across. Its general contour, together with the numerous branches that interlace its massive crown, give this elm a graceful appearance of stately beauty. This tree has a character all its own, and is ideal near higher buildings or for distance effect.

Moline Elm. (Transplanted).

Vase Elm

Growing to a considerable height on a sturdy trunk, this tree derives its name from the "vase" formation of the branches which comprise its upper growth. It prefers rich and moist soil, but will grow in the poor soil of a city street. It is a fast grower and uniform in habit. It is graceful, sound and permanent, and cannot fail to adorn and beautify its surroundings. A tree like the Vase Elms pictured, properly placed on your property, will call for more than a casual glance from those passing by.

Norway Maple

Luxurious is the word for this tree! Rising to some distance on a straight, strong trunk, its thick upper branches form a large rounded head with heavy shining foliage which stays dark green throughout the summer, turning to a gorgeous crown of golden yellow in late fall. The leaves are five-lobed, but not deeply cut, making them seem larger than other Maples. The bark is dark gray, tending to a lighter shade in the younger branches.

DOBE
Tree Farm

The Vase Elm.

The Norway Maple is very popular for street and lawn shade planting, and is most desirable for general city planting, since it is very hardy, comparatively free from insects and disease, will grow in poor soil and withstand drought. It puts out its leaves earlier in the spring and retains its verdure later in the fall than some varieties. Where the main purpose is to provide heavy shade on the lawn for children to play, or as a street tree, it has a distinct advantage. Another illustration on page 8 shows how effective this tree can be used for shading the house and in contrast to the evergreens.

*Norway Maple.
(Landscaping).*

Hard Sugar Maple

This is a sturdy native tree, which grows to a height of 80 to 100 feet, and presents an elegant appearance. It is probably the most valuable hard wood tree in America, its close-grained wood being used for all sorts of fine furniture. Most of the commercial maple sugar and syrup is derived from its sap. The crown is oval when the tree is young, and becomes symmetrically rounded as it grows older. The leaves of this majestic tree turn bright yellow, orange and scarlet as summer wanes, making it unusually attractive in the fall. This tree is fine for use in parks, bedecking lawns and streets, where its dense shade in summer and brilliant color in autumn is practical

Hard Sugar Maple

and pleasing. The Hard Sugar Maple cannot fail to be a source of delight and pride to the owner.

Scwedleri Purple Maple

Scwedleri Purple Maple

A distinctive and beautiful tree of good size, with young leaves purple red in the spring, changing to a dark purplish green, and then to a golden red late in summer. It is hardy and vigorous and fine for general planting. Its unusual color and changing aspect make it very desirable for ornamental planting, and is a fine shade tree as well. When viewed across an open lawn, or at the end of a vista, it is most effective.

DOBE
Tree Farm

American Linden. An Excellent Tree
for Landscaping and a Generous Shade
Giver.

American Linden

This is an abundant and useful tree with a luxuriant, ovate top. Its creamy white flowers are very fragrant and besieged with honey bees. Following the flowers, it puts forth clusters of small, nut-like fruits, attached to a curious winged bract, which also make it attractive. The leaves are large and heart-shaped, and grow in abundance on a strong straight trunk. The bark is smooth, grayish and with a peculiar zig-zag arrangement of the twigs—very interesting in winter. It attains quite a height, 50 to 130 feet. It has even-textured wood, and is handsome and symmetrical on the lawn, where it can have the fullest development as pictured here. American Lindens are frequently planted as street trees and for general shade purposes.

DOBE
Tree Farm

Cut Leaf Birch. Extremely Ornamental.

Cut Leaf Birch

This is an extremely ornamental tree with a straight trunk, reddish branches and small divided cut leaves. Quite erect when young, as it grows older the branches droop slightly, giving it a delicately graceful appearance. A striking feature of this tree is the satiny white bark which is familiar to all in its picturesque beauty. Its graceful habit, attractive white bark and the delicate tracery of its leaves, give the tree an important place in ornamental planting. Set against a background of evergreens, they are most effective. It is extensively used to line walks and drives and extremely ornamental when planted in groups. A birch close to a blue spruce, with the bird bath in the foreground, makes a very interesting and pleasing picture as shown on page 23.

PLANT SHADE TREES FOR SUMMER

COMFORT

The Hackberry

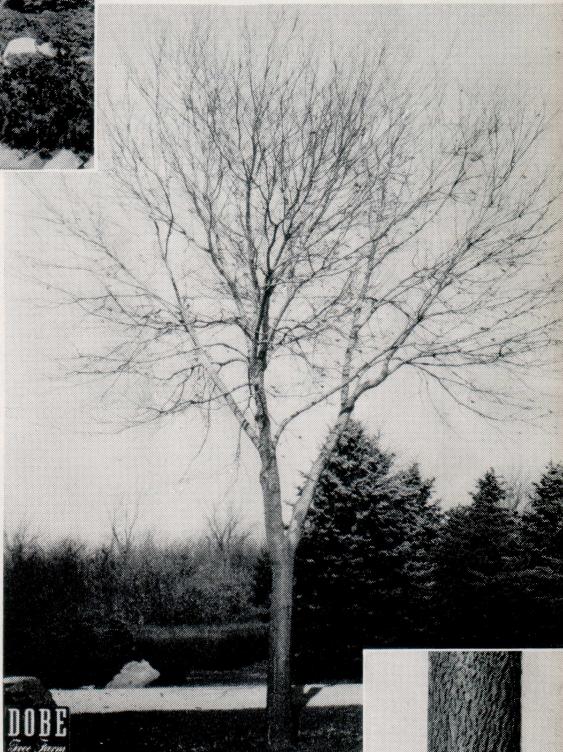

Left: Elm, Maple and Hackberry Group . . . Landscaped by Dobe Tree Farm.

Below: Hackberry. (Specimen)

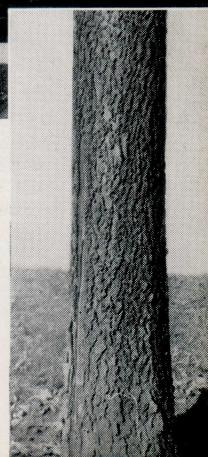

DOBE
Tree Farm

A medium sized tree with a compact, round to conical top, attractive spreading branches and elm-like leaves of a glossy, light green. The bark on its sturdy trunk is covered with corky tubercles, which gives it an unusual appearance. It is extremely hardy, grows naturally in fertile soils, but will adapt itself to almost sterile soils as well. It is planted extensively as a shade tree and used as an ornamental tree on the finest landscaped grounds. It bears dark purple berries. This is an extremely practical tree for widespread planting.

One of our illustrations on this page shows the Hackberry used in an interesting group with Elm and Maple and an attractive evergreen planting.

*The Trunk of the Hackberry,
Showing "Corky" Formation.*

Honey Locust

A handsome, satisfactory tree, practical, permanent and dependable. It is highly suitable for lawns, desirable for specimen or group planting, street and hedge use as well. It develops into a tall, spreading, round-topped tree, with compound leaves composed of very small leaflets, which give the effect of fine texture. The drooping clusters of fragrant, creamy white flowers are very enjoyable. The flowers are followed by large flat seed pods, which also lend interest to the tree. It grows rapidly and casts a light pleasing shade. It resembles the elm somewhat, but is in some respects more picturesque.

Honey Locust. (Thornless). Picturesque, Practical and Permanent.

Dobe Trees

HARDY,
DEPENDABLE,
BEAUTIFUL

We invite you to inspect some of America's finest shade trees and evergreens on the Show Grounds of the Dobe Tree Farm. Here are actually thousands of fine big hardy and beautiful trees that will give you joy to behold as well as inspiration for the improvement of your own grounds.

Come and see our trees and plan a new setting for yourself. It is our belief that if you plant trees you will live longer, get more enjoyment out of life and bring more happiness to others.

Evergreens

EVER GREEN . . . EVER LOVELY

EVERGREENS are just what the name implies—ever green—ever lovely. In all the vast store of plants for ornamental purposes, no one can equal the satisfying richness of evergreens. They are the aristocrats of the plant world, but are not too proud to serve you in many ways. In landscape planting evergreens are invaluable for use as windbreaks, hedges, screens against unattractive views and for feature plantings, either as single specimens or in groups.

The indispensability of evergreens in ornamental planting is most strikingly demonstrated in Winter, when deciduous trees and shrubs have lost their leaves. Then evergreens come into their own! They lend their softening influence to the cold lines of architecture and continue to serve as screens against unpleasant views when deciduous plants have taken a vacation. The play of light and shadow in evergreens is something to warm the heart and delight the eye; festooned with snow, they present a picture of incredible loveliness. Any way you take it, you get a lot for your money when you buy evergreens!

Since evergreens retain their foliage throughout the Winter, necessarily they are also giving off moisture, and in order that they may give off this moisture, they must have a reserve supply in the soil. Evergreens, therefore, should be watered at the approach of Winter, and if they are at all dry, they should be given a good soaking in the middle of Winter. In Summer, of course, together with other trees, they should have an abundance of water.

Many evergreens grow in extremely sterile locations. Nevertheless, most evergreens enjoy fertile soil and should be given some plant food to supplement the natural resources of the soil, especially in cities, where leaves and other natural sources of food are swept up and burned.

Colorado Blue Spruce

Here is truly a most outstanding example of nature's success in producing the beautiful. A perfectly shaped tree, with abundant foliage of a rich, glistening blue, which sparkles in the sunlight. The specimen here displayed gives some idea of the magnificent beauty of this wonderful tree. Its graceful branches festooned with snow presents an impressive sight, and lends an indescribable note of cheer to any winter landscape in the country or in the city. By reason of its massive size, this evergreen is very effective when used as a setting for large shade trees. We have many trees, such as the one the grower is admiring here, and many a group of these beautiful spruces from which we invite you to pick the perfect specimen for your property.

Colorado Blue Spruce. Magnificent and Amazing Beauty.

Concolor Abies Fir

By far the most outstanding Fir, it withstands severe winter conditions and survives summer heat much better than other firs. It rarely exceeds twenty feet in height with intense silvery foliage, the color running from pale green to light blue. It resembles the Colorado Blue Spruce somewhat, but is softer in texture and develops into a narrow pyramid of shapely symmetrical form, without stiffness. When small, it has a tendency to grow rather irregularly, but assumes its natural symmetrical even growth as it becomes older. Its needles are long, broad and flat, blunt on the ends and tender in appearance. It has a pungent

Concolor Abies Fir. Pyramids of shapely Loveliness.

fragrance that is very pleasing. A favorite for specimen planting, the spread of the branches in young, healthy trees is wide in proportion to the height, and they should be given plenty of room for perfect adornment.

Douglas Fir. (With Seed Cones). Graceful Hardy Giants.

DOBE EVERGREENS
ADD A CHEERFUL
NOTE TO ANY
LANDSCAPE

Douglas Fir

This is one of the fastest growing and most beautiful of the evergreens. In point of size and permanent quality, it is outstanding. The habit of the tree is graceful, and it is very hardy, stands crowding well, and will thrive in considerable shade. It responds very well to trimming and can be kept a desirable size and shape with little trimming in the spring. It has blunt, flat needles of the fir type, although they are longer and narrower than the needles of most firs, and present a pleasingly soft effect. Its color varies from deep green to light gray green. The giant specimens pictured below, towering above the figure of the man, with wide spread branches, show how really impressive these marvelous trees are.

Douglas Fir. Left: Landscape Group. Right: Specimen.

DOBE
Tree Farm

Juniper Cannarti Field on Dobe Tree Farm.

Above: Juniper Scopolorum Group. Below Left: Pyramidal. Right: (Specimen).

Juniper Cannarti

This is a pyramidal, compact grower of medium size, reaching 15 to 20 feet. It is perfectly hardy, stands trimming very well and requires very little trimming to keep it in perfect shape. It has rich green, fluffy tufted foliage of the whipcord type rather than the needle form, and bears clusters of silvery blue berries, which adhere late in the autumn and give the tree a striking and unusual effect. These Juniper berries serve as food for birds in the winter, which they enjoy greatly. Its color, which never varies the year around, and the berries which give it a lovely, frosty appearance, make this one of the best evergreens for use in the finest gardens.

Juniper Scopolorum

Narrow, compact and symmetrical, it has one single stem in contrast to some varieties of Junipers with several stems. This makes it safe from wind and heavy snows. Its color is gray to a bright silvery blue, with tender foliage. It retains a good healthy color throughout the winter and the heat of the summer. Its narrow, columnar growth and gracefully growing branches, which ascend almost vertically, make it unusually useful for ornamental planting where an economy of space is to be desired. The group of specimens pictured above to the left show better than words the possibilities of this tree as an aid to ornamental planting. Landscape artists never fail to include Juniper Scopolorum in a list of trees for ornamental use.

Juniper Glauca

This evergreen is very popular by reason of its glaucous blue color, which is especially attractive during the spring growing season, and adds a pleasing color contrast for landscape work. The growth is quite rapid, with slender, graceful branchlets, developing into a shapely pyramidal tree of moderate size. It is a beautiful, virile type of juniper, and by reason of its silvery blue foliage and free habit, is very popular with landscape artists. It is most effective when used for framing doorways, gateways and buildings. Perfect specimens, like the fine trees pictured here, are to be found in profusion among our stock. These trees have had a good start, and are hardy and dependable.

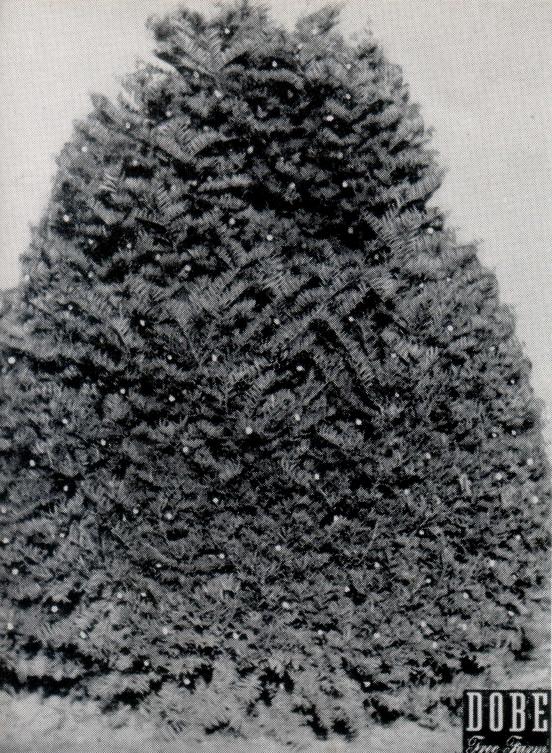

Upper Right: Juniper Glauca Field, Dobe Tree Farm. Lower Right: Juniper Pfitzer. Below: Juniper Glauca Group . . . Beautiful . . . Virile.

Juniper Pfitzer

This is one of the hardiest of all the evergreens and lends itself to a variety of uses. It is particularly useful where the soil is poor and sandy and where exposure to wind is unfavorable to tree growth. It has a low flat, spreading top, long graceful drooping branches with plumes of rich green foliage. Without training it assumes a low-spreading habit, which is desirable in some cases for background and screen effects. Since it is one of the best low-growing evergreens, it is much sought after for use about houses, in gardens, on slopes, in rockeries, in groups and for foundation planting.

DOBE
Tree Farm

Taxus Cuspidato. A Distinctive Yew for Ornamental Planting.

Taxus Cuspidata

A distinctly valuable Yew, it was introduced into America years ago, and has become one of the most noteworthy and valuable of the whole list for ornamental planting. It is dense and erect in habit, with a wide-spreading base. The needles are pointed and a vivid dark green in color throughout the year, with a bright yellow green new growth in spring. Attractive for the color and texture of the foliage, for their habit and red berries, they are extremely hardy under adverse conditions, will withstand considerable drought and cold, but will fare better if slightly protected from the wind. This species will do as well in the shade as in the open. Their compactness makes them particularly suitable for small places and foundation planting. These specimens pictured here are very beautiful and are some of our regular stock.

Below: Siberian Arbor Vitae. The Most Hardy Specimen.

Siberian Arbor Vitae

Conical in outline and covered with dark green foliage which is somewhat different from American Arbor Vitae, being much used for foundation planting, and frequently for hedges. It has a rugged constitution, is a symmetrical, compact grower and very long-lived. Its branches are short and stiff, the foliage extremely dense. This evergreen is extremely showy and widely used for ornamental purposes. It can be had in a variety of sizes.

DOBE
Tree Farm

Plant Evergreens

FOR YEAR 'ROUND BEAUTY AND HOME IMPROVEMENT

Evergreens are interesting and beautiful winter and summer . . . twelve months in the year . . . improve the appearance of any house and enhance the value of the property.

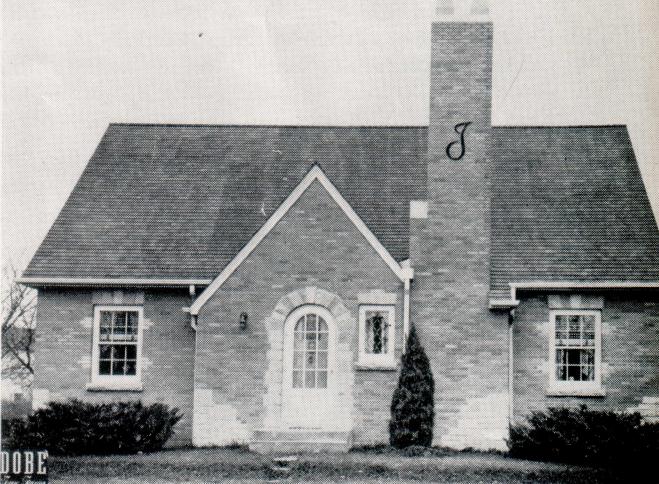

Friendly Evergreens

Pictured here is a modest planting of friendly evergreens which give a home-like touch to the house, impossible to acquire in any other way. Such plantings are inexpensive, require very little care and grow in value year after year.

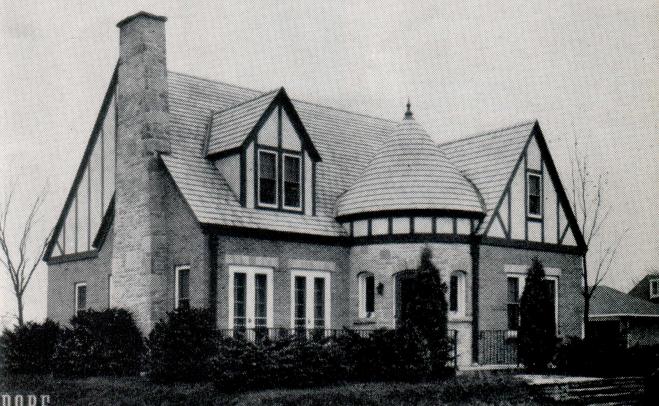

Companionable Evergreens

A simple planting of companionable evergreens, inexpensive but very effective. As pictured, a small house is made more attractive, more interesting and more valuable through the planting of just a few trees.

Rich Evergreens

Picture the house shown to the right without the attractive framing of rich evergreens. It would look barren and uninviting. Beautiful evergreens add beauty and value to any home.

A comfortable, moderate sized house, shaded by Vase and American Elms. Nothing adds more to the attractiveness, and value of a home than well-selected and well-placed trees of good quality.

Trees Go A Long Way

TO MAKE A HOUSE INTO A PLEASANT HOME

In the planning of a new home, the remodeling of an older one, or a general fixing up of a time-worn house to make it more attractive in appearance-competition with newer neighbors, trees will provide that certain something needed to make your dream home come true.

We can build a house, but to make it also a home we must add certain equipment and furnishings . . . furniture, rugs, draperies, pictures. Only with these things is our house a livable, comfortable home. We can build in the best design, of the finest materials obtainable but until we plant trees our beautiful house is like a beautiful picture without a frame. Trees go a long way to make a house into a home.

As trees improve our individual homes they likewise improve our business homes, public buildings and institutions. They emphasize the beauty of fine buildings, hide the defects of unattractive ones, build prestige, create respect and add value which grows throughout the years.

We will consider it a privilege and a pleasure to show you how Dobe Trees can improve your property.

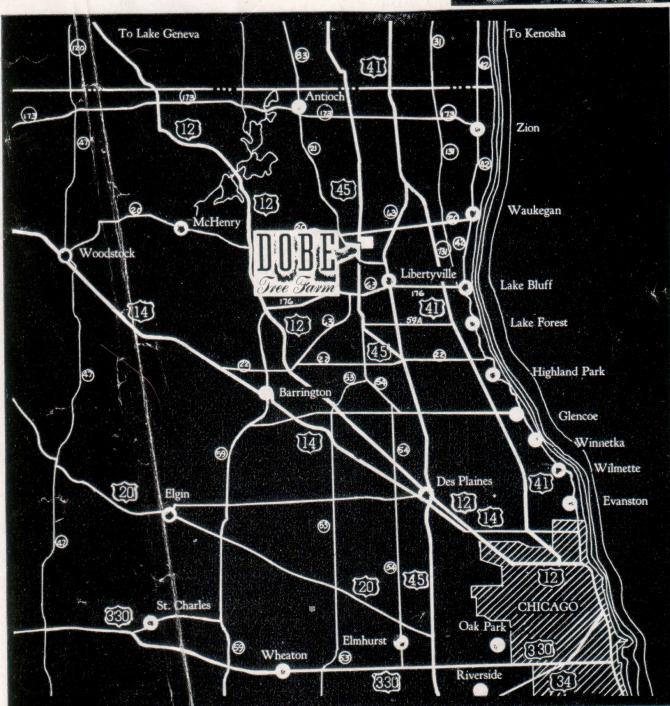

Dobe evergreens used to beautify a larger residence. Friendly sentinels guarding a terrace stairway and framing a patio entrance.
